

Oceanus-ERP Software Description

CM-IV (Chuck)

What will the application do?

My goal is to help in the creation and subsequent flourishing of small businesses through automation and the adoption of Monero payments. To that end, *Oceanus ERP* is terminal-based software that a small business or organization owner could use in order to handle daily business activities. *Oceanus ERP* can manage clients, services, invoices, and projects - but what sets it apart from any regular ERP application is its ability to handle Monero payments and generate invoices with the assigned wallet address QR code on them. Once the user initializes a Monero payment, they can then generate an invoice using that subaddress while keeping track of its pending status.

What users does the application target?

B2B - this application works towards the increase of Monero adoption while targeting other small business owners/managers that would like to automate and handle their monotonous routines. I'd like for *Oceanus ERP* to be the preferred application for dealing with everyday business dealings, as the missing link for inter-operability between spreadsheet editors and databases.
